Introduction

Types of cold-formed steel sections

- Profiled sheets and linear trays sections
Introduction

Advantages

• Advantages of Using Cold-Formed Steel Sections
  • Lightness;
  • High strength and stiffness;
  • Ability to provide long spans;
  • Easy prefabrication and mass production;
  • Fast and easy erection and installation;
  • Substantial elimination of delay due to the weather;
  • More accurate detailing;
  • Non-shrinking and non-creeping at ambient temperatures;
  • Form work unneeded;
  • Termite-proof and rat-proof;
  • Uniform quality;
  • Economy in transportation and handling;
  • Non combustibility;
  • Recyclable material.

Peculiar Problems of Cold-Formed Steel Design

• Buckling modes for a lipped channel in compression

Single modes:
(a) local (L);
(b) distortional (D);
(c) flexural (F);
(d) torsional (T);
(e) flexural-torsional (FT).

Coupled (interactive) modes:
(f) L + D;
(g) F + L;
(h) F + D;
(i) FT + L;
(j) FT + D;
(k) F + FT

Peculiar Problems of Cold-Formed Steel Design

- Open sections highly sensitive to torsional rigidity

Reduced torsional stiffness
Background and peculiarities

Introduction

Peculiar Problems of Cold-Formed Steel Design

- Web Crippling (Critical Problems)
  - In cold-formed steel design, it is often not practical to provide load bearing and end bearing stiffeners. This is always the case in continuous sheeting and decking spanning several support points.
  - The depth-to-thickness ratios of the webs of cold-formed members are usually larger than hot-rolled structural members.
  - In many cases, the webs are inclined rather than vertical.
  - The intermediate element between the flange, on which the load is applied, and member usually consists of a bend of finite

- EN 1090 – Part 2 „Execution of steel structures“

- General Rules & Buildings
  - Part 1
  - Part 2
  - Part 3
  - Part 4
  - Part 5
Introduction

Basis of Design

- Limit State Design > EN1990 (CEN, 2002a)
  - All the separate conditions that make a structure unfit for use are taken into account. These are the separate limit states;
  - The design is based on the actual behaviour of materials and performance of structures and members in service;
  - Ideally, design should be based on statistical methods with a small probability of the structure reaching a limit state.

Background and peculiarities

Introduction

Basis of Design

- Actions on Structures. Combinations of Actions (EN1991)
  - Verification at the Ultimate Limit State
  - Verification at the Serviceability Limit State

- Safety factors according to EN1990 (as for hot rolled steel)
- Factors:
  - $\gamma_{M0}$ – resistance of cross sections to excessive yielding including local and distortional buckling
  - $\gamma_{M1}$ – resistance of members and sheeting where failure is caused by global buckling
  - $\gamma_{M2}$ – resistance of net sections at fastener holes
Background and peculiarities

All steels used for cold-formed members and profiled sheets should be suitable for cold-forming and welding, if needed.
Materials (EN1993–1–3)

- Yield strength $f_{yb}$ and ultimate tensile strength $f_u$ should be obtained:
  - either by adopting the values $f_y = R_{eh}$ (upper yield strength) or $R_{p0.2}$ (proof strength) and $f_u = R_m$ (tensile strength) direct from product standards
  - by using the values given in Table 2.7a or b of EN1993–1–3
  - by appropriate tests (EN10002-1)
Background and peculiarities

Introduction

Basis of Design

- **Materials (EN1993–1–3)**
  - yield strength $f_{yb}$ and ultimate tensile strength $f_u$ should be obtained:
    - either by adopting the values $f_y = R_{eh}$ (upper yield strength) or $R_{p0.2}$ (proof strength) and $f_u = R_m$ (tensile strength) direct from product standards
    - by using the values given in Table 2.7a or b of EN1993–1–3
    - by appropriate tests (EN10002-1)
  - properties of cold-formed sections and sheeting
    - modification of the stress-strain curve of the steel (increase of the yield strength is due to strain hardening, the increase of the ultimate strength is related to strain aging)
    - coiling, uncoiling, cold reducing and the cold-forming process

\[
f_{yu} = f_{yb} + \left( f_u - f_{yb} \right) \frac{knt^2}{A_g} \quad \text{but} \quad f_{yu} \leq \frac{\left( f_u + f_{yb} \right)}{2}
\]

used for
- cross section resistance of an axially loaded tension member
- buckling resistance of members with fully effective cross section
**Methods of Analysis and Design**

- Methods of analysis – Global frame analysis
- Finite Element Methods (FEM) for analysis and design
- Design assisted by testing

- determine the distribution of the internal forces and the corresponding deformations in a structure subjected to a specified loading
- global analysis of frames is conducted on a model based on many assumptions including those for the structural model, the geometric and material behaviour of the structure, of its sections/members and joints.
  - (1) First-order elastic analysis;
  - (2) Second-order elastic analysis;
  - (3) Elastic-perfectly plastic analysis (Second-order theory);
  - (4) Elasto-plastic analysis (second-order theory);
  - (5) Rigid-plastic analysis (first-order theory)
Background and peculiarities

Introduction

Basis of Design

• Methods of Analysis and Design
  • Methods of analysis – Global frame analysis
  • Finite Element Methods (FEM) for analysis and design
  • Design assisted by testing

• guidance can be found in Annex C of EN1993-1-5
• The FE-modelling may be carried out either for:
  • (1) the component as a whole
  • (2) a substructure as a part of the whole structure. Also, design of members and details can be assisted by numerical simulations (e.g. numerical testing).
• Sectional imperfections for Local and Distortional Buckling modes
Background and peculiarities

Introduction

Basis of Design

• Design assisted by testing – may be undertaken under any of the following circumstances:
  • if it is desired to prove the validity and adequacy of an analytical procedure;
  • if it is desired to produce resistance tables based on tests, or on a combination of testing and analysis;
  • if it is desired to take into account practical factors that might alter the performance of a structure, but are not addressed by the relevant analysis method for design by calculation.

- ECCS No 124 -2008: Testing of connections with mechanical fasteners in sheeting and Sections
- ECCS no. 127-2009 Testing and design of fastenings in Sandwich panels
- En 15129 -2009: Steel static storage systems – Adjustable pallet racking systems
- EN 1990, Annex D : design assisted by testing (reliability and strength)
- EN 1993-1-3, Ch 9, Annex A
Design assisted by testing – may be undertaken under any of the following circumstances:

• if it is desired to prove the validity and adequacy of an analytical procedure;
• if it is desired to produce resistance tables based on tests, or on a combination of testing and analysis;
• if it is desired to take into account practical factors that might alter the performance of a structure, but are not addressed by the relevant analysis method for design by calculation.

Behaviour and Resistance of Cross Section

Effect of wall slenderness: Flange curling
Resistance of sections

Behaviour and Resistance of Cross Section

Effect of wall slenderness: Flange curling

George Winter (1940)

\[ p = \frac{\sigma_a \cdot t \cdot d\phi}{dl} = \frac{\sigma_a \cdot t}{\rho} = \frac{\sigma_a \cdot t}{E \cdot I / M} \]

- \( \sigma_a \) is the average (mean) bending stress in flange;
- \( E \) is the modulus of elasticity;
- \( I \) is the second moment of the beam area;
Resistance of sections

Behaviour and Resistance of Cross Section

Effect of wall slenderness: Flange curling

George Winter (1940)

\[ p = \frac{\sigma_a \cdot t \cdot d\phi}{dl} = \frac{\sigma_a \cdot t}{\rho} = \frac{\sigma_a \cdot t}{E \cdot I / M} \]

- \( \sigma_a \) is the average (mean) bending stress in flange;
- \( E \) is the modulus of elasticity;
- \( I \) is the second moment of the beam area;

If \( p \) is considered to be uniformly distributed load applied on the flange,

\[ u_f = \frac{p \cdot b_f^4}{8 \cdot D} = 3 \cdot \left( \frac{\sigma_a}{E} \right)^2 \cdot \left( \frac{b_f^4}{t^2 \cdot d} \right) \cdot (1 - \nu^2) \]

- \( u_f \) is flange deflection of outer edge;
- \( D \) is flexural rigidity of plate, \( D = E \cdot t^2 / 12 \cdot (1 - \nu^2) \);
- \( \nu \) is Poisson’s ratio.
Resistance of sections

Behaviour and Resistance of Cross Section

Flange curling

The ECCS Recommendations (ECCS, 1987) both compression and tensile flanges both with and without stiffeners:

\[ u_f = 2 \cdot \frac{\sigma_a^2 \cdot b_f^4}{E^2 \cdot t^2 \cdot z} \]
Resistance of sections

Behaviour and Resistance of Cross Section

Flange curling

The ECCS Recommendations (ECCS, 1987) both compression and tensile flanges both with and without stiffeners:

\[ u_f = 2 \cdot \frac{\sigma_a^2 \cdot b_f^4}{E^2 \cdot t_f^2 \cdot z} \]

Flange curling can be neglected in calculations if the deflection \( u_s < 5\% \).
Resistance of sections

Behaviour and Resistance of Cross Section

Flange curling

The ECCS Recommendations (ECCS, 1987) both compression and tensile flanges both with and without stiffeners:

$$u_f = \frac{2 \cdot \sigma_a \cdot b_f^4}{E^2 \cdot t^2 \cdot z}$$

Flange curling can be neglected in calculations if the deflection $u_s < 5\%$

to limit the curling effect

AISI S100-07

AS/NZS-4600:2005

$$b_f \leq \sqrt{\frac{0.06t \cdot d \cdot E}{\sigma_a}} \cdot d \cdot \sqrt{\frac{100 \cdot u_f}{d}}$$

$u_s < 0.05d.$

Behaviour and Resistance of Cross Section

Design Against Local and Distortional Buckling (EN1993-1-3)

• General

According to EN1993-1-3,

(a) The effects of local and distortional buckling shall be taken into account in determining the resistance and stiffness of cold-formed members and sheeting;

(b) Local buckling effects may be accounted for by using effective cross sectional properties, calculated on the basis of the effective widths of those elements that are prone to local buckling;

(c) The possible shift of the centroidal axis of the effective cross section relative to the centroidal axis of the gross cross section shall be taken into account;

(d) In determining resistance to local buckling, the yield strength $f_y$ should be taken as $f_{yb}$;
Resistance of sections

Behaviour and Resistance of Cross Section
Design Against Local and Distortional Buckling (EN1993-1-3)

• General

According to EN1993-1-3,

(e) In determining the resistance of a cross section, the effective width of a compression element should be based on the compressive stress \( \sigma_{\text{com,Ed}} \) in the element when the cross section resistance is reached;

(f) Two cross sections are used in design: gross cross section and effective cross section of which the latter varies as a function of loading (compression, major axis bending etc.);

(g) For serviceability verifications, the effective width of a compression element should be based on the compressive stress \( \sigma_{\text{com,Ed,ser}} \) in the element under the serviceability limit state loading;

(h) Distortional buckling shall be taken into account where it constitutes the critical failure mode.

Behaviour and Resistance of Cross Section
Design Against Local and Distortional Buckling (EN1993-1-3)

• EXAMPLE 2: Calculation of effective section properties for a cold-formed lipped channel section in compression

The dimensions of the cross section and the material properties are:
Total height \( h = 150 \text{ mm} \)
Total width of flange in compression \( b_1 = 47 \text{ mm} \)
Total width of flange in tension \( b_2 = 41 \text{ mm} \)
Total width of edge fold \( c = 16 \text{ mm} \)
Internal radius \( r = 3 \text{ mm} \)
Nominal thickness \( t_{\text{nom}} = 1 \text{ mm} \)
Steel core thickness (§§2.4.2.3) \( t = 0.96 \text{ mm} \)
Basic yield strength \( f_{yb} = 350 \text{ N/mm}^2 \)
Modulus of elasticity \( E = 210000 \text{ N/mm}^2 \)
Poisson’s ratio \( \nu = 0.3 \)
Partial factor (§§2.3.1) \( \gamma_{M0} = 1.00 \)
Resistance of sections

Behaviour and Resistance of Cross Section

**EXAMPLE 2: CFS in compression**

- **EXAMPLE 2: Calculation of effective section properties for a cold-formed lipped channel section in compression**

The dimensions of the section centre line are:

\[
\begin{align*}
    h_p &= h - t_{nom} = 150 - 1 = 149 \text{ mm} \\
    b_{p1} &= b_1 - t_{nom} = 47 - 1 = 46 \text{ mm} \\
    b_{p2} &= b_2 - t_{nom} = 41 - 1 = 40 \text{ mm} \\
    c_p &= c - t_{nom} / 2 = 16 - 1/2 = 15.5 \text{ mm}
\end{align*}
\]
Effective section properties of the flange and lip in compression

Final values of effective properties for flange and lip in compression are:

For the upper flange and lip:

\[ \chi_{d1} = 0.622 \text{, } b_{e1} = 20.65 \text{ mm} \text{, } c_{\text{eff1}} = 15.16 \text{ mm} \text{ and } b_{e1} = 17.57 \text{ mm} \]

For the bottom flange and lip:

\[ \chi_{d2} = 0.693 \text{, } b_{e2} = 18.92 \text{ mm} \text{, } c_{\text{eff2}} = 15.49 \text{ mm} \text{ and } b_{e2} = 16.86 \text{ mm} \]

\[ t_{\text{red},1} = t \chi_{d1} = 0.96 \times 0.622 = 0.597 \text{ mm} \]

\[ t_{\text{red},2} = t \chi_{d2} = 0.96 \times 0.693 = 0.665 \text{ mm} \]
Resistance of sections

Behaviour and Resistance of Cross Section

EXAMPLE 2: CFS in compression

- Effective section properties

Effective cross section area:

\[ A_{\text{eff}} = t \left[ b_{e11} + b_{e21} + h_{e1} + h_{e2} + \left( b_{e12} + c_{e11} \right) \chi_{d1} + \left( b_{e22} + c_{e12} \right) \chi_{d2} \right] \]

\[ A_{\text{eff}} = 117.37 \, \text{mm}^2 \]
Resistance of sections

Behaviour and Resistance of Cross Section

EXAMPLE 2: CFS in compression

• Effective section properties

Effective cross section area:

\[ A_{\text{eff}} = t \left[ b_{e1} + b_{e2} + h_1 + h_2 + \left( b_{e1} + c_{\text{eff}1} \right) \chi_{d1} + \left( b_{e2} + c_{\text{eff}2} \right) \chi_{d2} \right] \]

\[ A_{\text{eff}} = 117.37 \text{ mm}^2 \]

Position of the centroidal axis with regard to the upper flange:

\[ z_{G1} = \frac{t \left[ c_{\text{eff}2} \chi_{d2} \left( h_p - \frac{c_{\text{eff}2}}{2} \right) + h_p \left( b_{e2} \chi_{d2} + b_{e21} \right) + h_{e2} \left( h_p - \frac{h_{e2}}{2} \right) + \frac{h_{e1}^2}{2} + \frac{c_{\text{eff}1}^2 \chi_{d1}}{2} \right]}{A_{\text{eff}}} = 74.92 \text{ mm} \]

Position of the centroidal axis with regard to the bottom flange:

\[ z_{G2} = h_p - z_{G1} = 149 - 74.92 = 74.08 \text{ mm} \]
EXAMPLE 1: Calculation of effective section properties for a cold-formed lipped channel section in bending

The dimensions of the cross section and the material properties are:

- Total height: \( h = 150 \text{ mm} \)
- Total width of flange in compression: \( b_1 = 47 \text{ mm} \)
- Total width of flange in tension: \( b_2 = 41 \text{ mm} \)
- Total width of edge fold: \( c = 16 \text{ mm} \)
- Internal radius: \( r = 3 \text{ mm} \)
- Nominal thickness: \( t_{\text{nom}} = 1 \text{ mm} \)
- Steel core thickness (§2.4.2.3): \( t = 0.96 \text{ mm} \)
- Basic yield strength: \( f_{yb} = 350 \text{ N/mm}^2 \)

Resistance of sections

Behaviour and Resistance of Cross Section

EXAMPLE 1: CFS in bending

• Effective section properties
Resistance of sections

Behaviour and Resistance of Cross Section

EXAMPLE 1: CFS in bending

Effective section properties

Effective cross section area:

\[ A_{\text{eff}} = t[c_p + b_{p2} + h_1 + h_2 + b_{e1} + (b_{e2} + c_{\text{eff}})d] \]

\[ A_{\text{eff}} = 0.96 \times \left[ 15.5 + 40 + 20 + 99.5 + 17.57 + (20.736 + 12.77) \times 0.614 \right] \]

\[ A_{\text{eff}} = 204.62 \text{ mm}^2 \]
Resistance of sections

Behaviour and Resistance of Cross Section

**EXAMPLE 1: CFS in bending**

**Effective section properties**

Effective cross section area:

\[ A_{\text{eff}} = t \left[ c_p + b_{p2} + h_1 + b_{e1} + \left( b_{e2} + c_{\text{eff}} \right) \chi_d \right] \]

\[ A_{\text{eff}} = 0.96 \times \left[ 15.5 + 40 + 20 + 99.5 + 17.57 + \left( 20.736 + 12.77 \right) \times 0.614 \right] \]

\[ A_{\text{eff}} = 204.62 \text{ mm}^2 \]

Position of the neutral axis with regard to the flange in compression:

\[ z_c = \frac{t \left[ c_p \left( h_p - c_p / 2 \right) + b_{p2} h_p + h_2 \left( h_p - h_2 / 2 \right) + h_1^2 / 2 + c_{\text{eff}}^2 \chi_d / 2 \right]}{A_{\text{eff}}} \]

\[ z_c = 85.75 \text{ mm} \]
Effective section properties

Effective cross section area:

\[ A_{\text{eff}} = t \left[ c_p + b_{p2} + h_1 + h_2 + b_{e1} + (b_{s2} + c_{\text{eff}}) \chi_d \right] \]

\[ A_{\text{eff}} = 0.96 \times \left[ 15.5 + 40 + 20 + 99.5 + 17.57 + (20.736 + 12.77) \times 0.614 \right] \]

\[ A_{\text{eff}} = 204.62 \text{ mm}^2 \]

Position of the neutral axis with regard to the flange in compression:

\[ z_c = \frac{t \left[ c_p \left( h_p - c_p / 2 \right) + b_{p2} h_p + h_2 \left( h_p - h_2 / 2 \right) + h_1^2 / 2 + c_{\text{eff}} \chi_d \right]}{A_{\text{eff}}} \]

\[ z_c = 85.75 \text{ mm} \]

Position of the neutral axis with regard to the flange in tension:

\[ z_t = h_p - z_c = 149 - 85.75 = 63.25 \text{ mm} \]
**Effective section properties**

Second moment of area:

\[
I_{eff,y} = \frac{h_1^3 t}{12} + \frac{h_2^3 t}{12} + \frac{b_{p2} t^3}{12} + \frac{c_p^3 t}{12} + \frac{b_{e1} t^3}{12} + \frac{b_{e2}(\chi_d t)^3}{12} + \\
\frac{c_{eff}^3(\chi_d t)}{12} + c_p t (z_t - c_p / 2)^2 + b_{p2} t z_t^2 + h_2 t (z_t - h_2 / 2)^2 + \\
h_1 t (z_c - h_t / 2)^2 + b_{e1} t z_c^2 + b_{e2}(\chi_d t) z_c^2 + \\
c_{eff}(\chi_d t)(z_c - c_{eff} / 2)^2
\]

\[
I_{eff,y} = 668103 \text{ mm}^4
\]
Effective section properties

Second moment of area:

\[
I_{\text{eff},y} = \frac{h_1^3 t}{12} + \frac{h_2^3 t}{12} + \frac{b_p t^3}{12} + \frac{c_p^3 t}{12} + \frac{b_e t^3}{12} + \frac{b_e (\chi_d t)^3}{12} + \\
+ \frac{c_e^3 (\chi_d t)}{12} + c_p t(z_t - c_p/2)^2 + b_p t z_t^2 + h_2 t(z_t - h_2/2)^2 + \\
+ h_1 t(z_c - h_1/2)^2 + b_e t z_c^2 + b_e (\chi_d t) z_c^2 + \\
+ c_e (\chi_d t)(z_c - c_e/2)^2
\]

\[I_{\text{eff},y} = 668103 \text{ mm}^4\]

Effective section modulus:
- with regard to the flange in compression

\[W_{\text{eff},y,c} = \frac{I_{\text{eff},y}}{z_c} = \frac{668103}{85.75} = 7791 \text{ mm}^3\]

- with regard to the flange in tension

\[W_{\text{eff},y,t} = \frac{I_{\text{eff},y}}{z_t} = \frac{668103}{63.25} = 10563 \text{ mm}^3\]
Resistance of sections

Behaviour and Resistance of Cross Section

Resistance of Cross Sections

• Bending Moment - Elastic and elastoplastic resistance with yielding at the tension flange only

Provided that bending moment is applied only about one principal axis of the cross section, and provided that yielding occurs first at the tension edge, plastic reserves in the tension zone may be utilized without any strain limit until the maximum compressive stress $\sigma_{\text{com,Ed}}$ reaches $f_{\text{yb}}/\gamma_M$. In this paragraph the pure bending case is considered. For combined axial load and
Resistance of sections

Behaviour and Resistance of Cross Section

Resistance of Cross Sections

• **Bending Moment - Elastic and elastoplastic resistance with yielding at the tension flange only**

  Provided that bending moment is applied only about one principal axis of the cross section, and provided that yielding occurs first at the tension edge, plastic reserves in the tension zone may be utilized without any strain limit until the maximum compressive stress $\sigma_{com,Ed}$ reaches $f_{yb}/\gamma_{M0}$. In this paragraph the pure bending case is considered. For combined axial load and

  When accounting for plastic reserve capacity, the effective partially plastic section modulus $W_{pp,eff}$ should be based on a stress distribution that is bilinear in the tension zone but linear in the compression zone.
Resistance of sections

Behaviour and Resistance of Cross Section

Resistance of Cross Sections – *Bending Moment*

• Example – Design of a cold-formed steel member in bending

**Basic Data**

- Span of joist: \( L = 5.5 \text{ m} \)
- Spacing between joists: \( S = 0.6 \text{ m} \)

Distributed loads applied to the joist:

- Self-weight of the beam: \( q_{G,\text{beam}} = 0.06 \text{ kN/m} \)
- Lightweight slab: \( 0.75 \text{ kN/m}^2 \)
- Dead load: \( q_G = q_{G,\text{beam}} + q_{G,\text{slab}} = 0.51 \text{ kN/m} \)
- Imposed load: \( q_O = 2.50 \times 0.6 = 1.50 \text{ kN/m} \)
Resistance of sections

Behaviour and Resistance of Cross Section

Resistance of Cross Sections – Bending Moment

- Example – Design of a cold-formed steel member in bending

Basic Data

The dimensions of the cross section and the material properties are:

- Total height \( h = 200 \text{ mm} \)
- Total width of flange in compression \( b_1 = 74 \text{ mm} \)
- Total width of flange in tension \( b_2 = 66 \text{ mm} \)
- Total width of edge fold \( c = 20.8 \text{ mm} \)
- Internal radius \( r = 3 \text{ mm} \)
- Nominal thickness \( t_{\text{nom}} = 2 \text{ mm} \)
- Steel core thickness \( t = 1.96 \text{ mm} \)
- Basic yield strength \( f_{\text{yb}} = 350 \text{ N/mm}^2 \)
- Modulus of elasticity \( E = 210000 \text{ N/mm}^2 \)
- Poisson’s ratio \( \nu = 0.3 \)
- Partial factors
  - \( \gamma_M = 1.0 \)
  - \( \gamma_{M1} = 1.0 \)
  - \( \gamma_G = 1.35 \) – permanent loads
  - \( \gamma_Q = 1.50 \) – variable loads
Resistance of sections

- Checking for Bending moment, $M_{Rd}$
- Checking for Shear, $V_{Rd}$
- Checking for transverse force (web crippling), $R_{Rd}$
- Checking for interaction $M_{Rd} + V_{Rd}$
- Checking for interaction $M_{Rd} + R_{Rd}$
Behaviour and Resistance of Cross Section

Resistance of Cross Sections – *Bending Moment*

- **Example – Design of a cold-formed steel member in bending**

**Effective section properties at the ULS**

Second moment of area of cold-formed lipped channel section subjected to bending about its major axis:

\[ I_{e,f,y} = 4139861 \text{ mm}^4 \]

Position of the neutral axis:
- from the flange in compression: \( z_c = 102.3 \text{ mm} \)
- from the flange in tension: \( z_t = 95.7 \text{ mm} \)

Effective section modulus:
- with respect to the flange in compression:
  \[ W_{e,f,y,c} = \frac{I_{e,f,y}}{z_c} = \frac{4139861}{102.3} = 40463 \text{ mm}^3 \]
- with respect to the flange in tension:
  \[ W_{e,f,y,t} = \frac{I_{e,f,y}}{z_t} = \frac{4139861}{95.7} = 43264 \text{ mm}^3 \]
**Resistance of sections**

**Behaviour and Resistance of Cross Section**

**Resistance of Cross Sections – Bending Moment**

- **Example – Design of a cold-formed steel member in bending**

Effective section properties at the ULS

Second moment of area of cold-formed lipped channel section subjected to bending about its major axis:

\[ I_{\text{eff},y} = 4139861 \text{ mm}^4 \]

Position of the neutral axis:
- from the flange in compression: \( z_c = 102.3 \text{ mm} \)
- from the flange in tension: \( z_t = 95.7 \text{ mm} \)

Effective section modulus:
- with respect to the flange in compression:

\[ W_{\text{eff},y,c} = \frac{I_{\text{eff},y}}{z_c} = \frac{4139861}{102.3} = 40463 \text{ mm}^3 \]

- with respect to the flange in tension:

\[ W_{\text{eff},y,t} = \frac{I_{\text{eff},y}}{z_t} = \frac{4139861}{95.7} = 43264 \text{ mm}^3 \]

\[ W_{\text{eff},y} = \min \left( W_{\text{eff},y,c}, W_{\text{eff},y,t} \right) = 40463 \text{ mm}^3 \]
**Resistance of Sections**

**Behaviour and Resistance of Cross Section**

**Resistance of Cross Sections – *Bending Moment***

- **Example – Design of a cold-formed steel member in bending**

Applied loading on the joist at the ULS

\[
q_d = \gamma_G q_G + \gamma_Q q_Q = 1.35 \times 0.51 + 1.50 \times 1.50 = 2.94 \text{ kN/m}
\]

Maximum applied bending moment (at mid-span) about the major axis y-y:

\[
M_{Ed} = q_d L^2 / 8 = 2.94 \times 5.5^2 / 8 = 11.12 \text{ kNm}
\]

**Check of bending resistance at ULS**

Design moment resistance of the cross section for bending

\[
M_{c,Rd} = W_{eff,y} f_{yb} / \gamma_M 0 = 40463 \times 10^{-9} \times 350 \times 10^3 / 1.0 = 14.16 \text{ kNm}
\]

**Verification of bending resistance**

\[
\frac{M_{Ed}}{M_{c,Rd}} = \frac{11.12}{14.16} = 0.785 < 1 \quad - \text{OK}
\]
Resistance of members

Compression members

• Buckling resistance of uniform members in compression. Design according to EN1993-1-3

\[ \frac{N_{Ed}}{N_{b.Rd}} \leq 1 \]

where

- \( N_{Ed} \) is the design value of the compression force;
- \( N_{b.Rd} \) is the design buckling resistance of the compression member.
Resistance of members
Compression members

- **Buckling resistance of uniform members in compression.** Design according to EN1993-1-3

\[ \frac{N_{Ed}}{N_{b,Rd}} \leq 1 \]

where

- \( N_{Ed} \) is the design value of the compression force;
- \( N_{b,Rd} \) is the design buckling resistance of the compression member.

The design buckling resistance of a compression member with Class 4 cross section should be taken as:

\[ N_{b,Rd} = \frac{\chi A_{eff} f_y}{\gamma_{M1}} \]  (4.46)

where \( \chi \) is the reduction factor for the relevant buckling mode.
• **Buckling resistance of uniform members in compression.**

Design according to EN1993-1-3

\[
\frac{N_{Ed}}{N_{b,Rd}} \leq 1
\]

where

- \( N_{Ed} \) is the design value of the compression force;
- \( N_{b,Rd} \) is the design buckling resistance of the compression member.

The design buckling resistance of a compression member with Class 4 cross section should be taken as:

\[
N_{b,Rd} = \frac{\chi A_{eff} f_y}{\gamma_{M1}} \tag{4.46}
\]

where \( \chi \) is the reduction factor for the relevant buckling mode.

EN1993-1-1 + §§6.2.1 of EN1993-1-3
Resistance of members

Compression members

- **Buckling resistance of uniform members in compression. Design according to EN1993-1-3**

The design buckling resistance of a compression member with Class 4 cross section should be taken as:

\[ N_{b,Rd} = \frac{\chi A_{\text{eff}} f_y}{\gamma_{M1}} \]  

(4.46)

where \( \chi \) is the reduction factor for the relevant buckling mode.
Resistance of members

Compression members

• Buckling resistance of uniform members in compression. Design according to EN1993-1-3

The design buckling resistance of a compression member with Class 4 cross section should be taken as:

$$N_{b,Rd} = \frac{\chi A_{eff} f_y}{\gamma_{M1}}$$  \hspace{1cm} (4.46)

where $\chi$ is the reduction factor for the relevant buckling mode.

$$\chi = \frac{1}{\phi + \sqrt{\phi^2 - \lambda^2}}$$  \hspace{1cm} but $\chi \leq 1$
Resistance of members

Compression members

• Buckling resistance of uniform members in compression. Design according to EN1993-1-3

The design buckling resistance of a compression member with Class 4 cross section should be taken as:

\[ N_{b,Rd} = \frac{\chi A_{eff} f_y}{\gamma_{M1}} \]  \hspace{1cm} (4.46)

where \( \chi \) is the reduction factor for the relevant buckling mode.

\[ \chi = \frac{1}{\phi + \sqrt{\phi^2 - \bar{\lambda}^2}} \quad \text{but} \quad \chi \leq 1 \]

\[ \phi = 0.5 \left[ 1 + \alpha \left( \bar{\lambda} - 0.2 \right) + \bar{\lambda}^2 \right] \]
Resistance of members

Compression members

• Buckling resistance of uniform members in compression. Design according to EN1993-1-3

The design buckling resistance of a compression member with Class 4 cross section should be taken as:

\[ N_{b,Rd} = \frac{\chi A_{eff} f_y}{\gamma_{M1}} \]  

(4.46)

where \( \chi \) is the reduction factor for the relevant buckling mode.

\[ \chi = \frac{1}{\phi + \sqrt{\phi^2 - \overline{\lambda}^2}} \]  

but \( \chi \leq 1 \)

\[ \phi = 0.5 \left[ 1 + \alpha (\overline{\lambda} - 0.2) + \overline{\lambda}^2 \right] \]

\[ \overline{\lambda} = \sqrt{\frac{A_{eff} f_y}{N_{cr}}} \]  

for class 4 cross sections.

- Second moment of area about \( z-z \): \( I_z = 19.13 \times 10^4 \text{ mm}^4 \)
- Warping constant: \( I_w = 4.931 \times 10^8 \text{ mm}^6 \)
- Torsion constant: \( I_t = 266 \text{ mm}^4 \)

**Effective section properties of the cross section**

- Effective area of the cross section when subjected to compression only: \( A_{eff} = 322 \text{ mm}^2 \)
Resistance of members

Compression members

- Example – Design of an internal wall stud in compression

Properties of the gross cross section

Area of gross cross section: \( A = 592 \text{ mm}^2 \)

Radii of gyration: \( i_y = 57.2 \text{ mm} ; \ i_z = 18 \text{ mm} \)

Second moment of area about \( y-y \): \( I_y = 1.936 \times 10^6 \text{ mm}^4 \)

Second moment of area about \( z-z \): \( I_z = 19.13 \times 10^4 \text{ mm}^4 \)

Warping constant: \( I_w = 4.931 \times 10^8 \text{ mm}^6 \)

Torsion constant: \( I_t = 266 \text{ mm}^4 \)

Effective section properties of the cross section

Effective area of the cross section when subjected to compression only:

\( A_{eff} = 322 \text{ mm}^2 \)
Resistance of members

Compression members

• Example – Design of an internal wall stud in compression

Buckling resistance check

Members which are subjected to axial compression should satisfy

\[
\frac{N_{Ed}}{N_{b,Rd}} \leq 1
\]

\[N_{b,Rd} = \chi \frac{A_{eff} f_y}{\gamma_{M1}}\]

where \(\chi\) is the reduction factor for the relevant buckling mode.

\[
\chi = \frac{1}{\phi + \sqrt{\phi^2 - \bar{\lambda}^2}} \quad \text{but} \quad \chi \leq 1.0
\]

\[
\phi = 0.5 \left[1 + \alpha (\bar{\lambda} - 0.2) + \bar{\lambda}^2 \right]
\]

\(\alpha\) – imperfection factor

\[
\bar{\lambda} = \sqrt{\frac{A_{eff} f_{yb}}{N_{cr}}}
\]
Resistance of members

Compression members

- **Example** – *Design of an internal wall stud in compression*

**Buckling resistance check**

**Determination of the reduction factors \( \lambda_y, \lambda_z, \lambda_t \)**

**Flexural buckling**

\[
\lambda_F = \sqrt{\frac{A_{\text{eff}} f_{yb}}{N_{cr}}} = \frac{L_{cr}}{\sqrt{i} \lambda_1}
\]

The buckling length:

\[
L_{cr,y} = L_{cr,z} = H = 3000 \text{ mm}
\]

\[
\lambda_1 = \pi \sqrt{\frac{E}{f_{yb}}} = \pi \times \sqrt{\frac{210000}{350}} = 76.95
\]

Buckling about \( y-y \) axis

\[
\lambda_y = \frac{L_{cr,y}}{i_y} \frac{\sqrt{A_{\text{eff}}/A}}{\lambda_1} = \frac{3000}{57.2} \times \frac{\sqrt{322/592}}{76.95} = 0.503
\]

\( \alpha_y = 0.21 \)
Resistance of members

Compression members

- Example – *Design of an internal wall stud in compression*

**Buckling resistance check**

**Determination of the reduction factors** $\lambda_y$, $\lambda_z$, $\lambda_r$

Buckling about $y-y$ axis

$$\bar{\lambda}_y = \frac{L_{cr,y}}{i_y} \sqrt{\frac{A_{eff}}{A}} = \frac{3000 \times \sqrt{322/592}}{57.2 \times 76.95} = 0.503$$

$\alpha_y = 0.21$

$$\phi_y = 0.5 \left[ 1 + \alpha_y \left( \bar{\lambda}_y - 0.2 \right) + \bar{\lambda}_y^2 \right] = 0.5 \times \left[ 1 + 0.21 \times (0.503 - 0.2) + 0.503^2 \right] = 0.658$$

$$\lambda_y = \frac{1}{\phi_y + \sqrt{\phi_y^2 - \bar{\lambda}_y^2}} = \frac{1}{0.658 + \sqrt{0.658^2 - 0.503^2}} = 0.924$$
Resistance of members

Compression members

• Example – *Design of an internal wall stud in compression*

Buckling resistance check

Determination of the reduction factors $\chi_y$, $\chi_z$, $\chi_t$

Buckling about $z$–$z$ axis

$$\bar{\lambda}_z = \frac{L_{cr,z}}{i_z} \sqrt{\frac{A_{eff}}{A}} = \frac{3000}{18} \times \sqrt{\frac{322/592}{76.95}} = 1.597$$

$$\alpha_z = 0.34$$

$$\phi_z = 0.5 \left[ 1 + \alpha_z \left( \bar{\lambda}_z - 0.2 \right) + \bar{\lambda}_z^2 \right] = 0.5 \times \left[ 1 + 0.34 \times (1.597 - 0.2) + 1.597^2 \right] = 2.013$$

$$\chi_z = \frac{1}{\phi_z + \sqrt{\phi_z^2 - \bar{\lambda}_z^2}} = \frac{1}{2.013 + \sqrt{2.013^2 - 1.597^2}} = 0.309$$
Resistance of members

Compression members

- Example – Design of an internal wall stud in compression

Buckling resistance check

Determination of the reduction factors $\chi_y$, $\chi_z$, $\chi_T$

Torsional buckling

$$N_{cr,T} = \frac{1}{i_o^2} \left( GI_t + \frac{\pi^2 EI_w}{l_T^2} \right)$$

where

$$i_o^2 = i_y^2 + i_z^2 + y_o^2 + z_o^2$$
$$y_o = z_o = 0$$
$$i_o^2 = 57.2^2 + 18^2 + 0 + 0 = 3594 \, \text{mm}^2$$

$$l_T = H = 3000 \, \text{mm}$$

The elastic critical force for torsional buckling is:

$$N_{cr,T} = \frac{1}{3594} \times \left( 81000 \times 266 + \frac{\pi^2 \times 210000 \times 4.931 \times 10^8}{3000^2} \right) = 37.59 \times 10^3 \, \text{N}$$
Resistence of members

Compression members

• Example – Design of an internal wall stud in compression

Buckling resistance check

Determination of the reduction factors $\chi_y$, $\chi_z$, $\chi_T$

Torsional buckling

$$N_{cr,T} = \frac{1}{i_0^2} \left( GI_t + \frac{\pi^2 EI_w}{l_T^2} \right)$$

where

$$i_0^2 = i_y^2 + i_z^2 + y_o^2 + z_o^2$$

$$y_o = z_o = 0$$

$$i_o^2 = 57.2^2 + 18^2 + 0 + 0 = 3594 \text{ mm}^2$$

$$l_T = H = 3000 \text{ mm}$$

The elastic critical force for torsional buckling is:

$$N_{cr,T} = \frac{1}{3594} \times \left( 81000 \times 266 + \frac{\pi^2 \times 210000 \times 4.931 \times 10^8}{3000^2} \right) =$$

$$= 37.59 \times 10^3 \text{ N}$$

The elastic critical force will be: $N_{cr} = N_{cr,T} = 37.59 \text{ kN}$
Resistance of members

Compression members

- Example – *Design of an internal wall stud in compression*

**Buckling resistance check**

**Determination of the reduction factors $\chi_T$, $\chi_3$, $\chi_1$**

**Torsional buckling**

The non-dimensional slenderness is:

$$\bar{\lambda}_T = \sqrt{\frac{A_{\text{eff}} f_{yb}}{N_{cr}}} = \sqrt{\frac{322 \times 350}{37.59 \times 10^3}} = 1.731$$

$$\alpha_T = 0.34 \quad \text{buckling curve } b$$

$$\phi_T = 0.5 \left[ 1 + \alpha_T \left( \bar{\lambda}_T - 0.2 \right) + \bar{\lambda}_T^2 \right] = 0.5 \times \left[ 1 + 0.34 \times (1.731 - 0.2) + 1.731^2 \right] = 2.258$$

The reduction factor for torsional buckling is:

$$\chi_T = \frac{1}{\phi_T + \sqrt{\phi_T^2 - \bar{\lambda}_T^2}} = \frac{1}{2.258 + \sqrt{2.258^2 - 1.731^2}} = 0.270$$
Resistance of members

Compression members

- Example – *Design of an internal wall stud in compression*

Buckling resistance check

Determination of the reduction factors $\chi_y$, $\chi_z$, $\chi_T$

$$\chi = \min(\chi_y, \chi_z, \chi_T) = \min(0.924, 0.309, 0.270) = 0.270$$

$$N_{b,Rd} = \frac{\chi A_{eff} f_y}{\gamma_{M1}} = \frac{0.270 \times 322 \times 350}{1.00} = 30429 \text{N} = 30.429 \text{kN}$$

$$\frac{N_{Ed}}{N_{b,Rd}} = \frac{16.79}{30.429} = 0.552 \leq 1 - \text{OK}$$

- Theoretical background
Resistance of members

Buckling strength of bending members

- Design according to EN1993-1-3

  *Lateral-torsional buckling of members subject to bending*

  A laterally unrestrained member subject to major axis bending should be verified against lateral-torsional buckling as follows:

  \[
  \frac{M_{Ed}}{M_{b,Rd}} \leq 1.0
  \]

  where

  - \(M_{Ed}\) is the design value of the moment;
  - \(M_{b,Rd}\) is the design buckling resistance moment.
Resistance of members

Buckling strength of bending members

- Design according to EN1993-1-3

*Lateral-torsional buckling of members subject to bending*

A laterally unrestrained member subject to major axis bending should be verified against lateral-torsional buckling as follows:

\[
\frac{M_{Ed}}{M_{b,Rd}} \leq 1.0
\]

where
- \(M_{Ed}\) is the design value of the moment;
- \(M_{b,Rd}\) is the design buckling resistance moment.

The design buckling resistance moment of a laterally unrestrained beam should be taken as:

\[
M_{b,Rd} = \chi_{LT} W_y f_y / \gamma_{M1}
\]

where
- \(W_y\) is the appropriate section modulus as follows:
  - \(W_y = W_{el,y}\) is for class 3 cross section;
  - \(W_y = W_{eff,y}\) is for class 4 cross section;
Resistance of members

Buckling strength of bending members

- Design according to EN1993-1-3

_Lateral-torsional buckling of members subject to bending_

In determining \( W_y \), holes for fasteners at the beam ends need not to be taken into account.

\( \chi_{LT} \) is the reduction factor for lateral-torsional buckling,

\[
\chi_{LT} = \frac{1}{\phi_{LT} + \left( \phi_{LT}^2 - \overline{\lambda}_{LT}^2 \right)^{0.5}}, \text{ but } \chi_{LT} \leq 1
\]

with: \( \phi_{LT} = 0.5 \left[ 1 + \alpha_{LT} (\overline{\lambda}_{LT} - 0.2) + \overline{\lambda}_{LT}^2 \right] \);

\( \alpha_{LT} \) is the imperfection factor corresponding to buckling curve \( b \), \( \alpha_{LT} = 0.34 \);

\[
\overline{\lambda}_{LT} = \sqrt{\frac{W_y f_y}{M_{cr}}};
\]

Buckling strength of bending members

- **Example – Design of an cold-formed steel beam in bending**

**Effective section properties at the ultimate limit state**

Second moment of area of cold-formed lipped channel section subjected to bending about its major axis:

\[ I_{\text{eff},y} = 22688890 \text{ mm}^4 \]

Position of the neutral axis:

- from the flange in compression: \( z_c = 124.6 \text{ mm} \)
- from the flange in tension: \( z_t = 122.4 \text{ mm} \)

Effective section modulus:

- with respect to the flange in compression:
  \[ W_{\text{eff},y,c} = \frac{I_{\text{eff},y}}{z_c} = \frac{22688890}{124.6} = 182094 \text{ mm}^3 \]

- with respect to the flange in tension:
  \[ W_{\text{eff},y,t} = \frac{I_{\text{eff},y}}{z_t} = \frac{22688890}{122.4} = 185367 \text{ mm}^3 \]
Residence of members

Buckling strength of bending members

- Example – Design of an cold-formed steel beam in bending

Effective section properties at the ultimate limit state
Second moment of area of cold-formed lipped channel section subjected to bending about its major axis:

\[ I_{\text{eff},y} = 22688890 \text{ mm}^4 \]

Position of the neutral axis:
- from the flange in compression: \( z_c = 124.6 \text{ mm} \)
- from the flange in tension: \( z_f = 122.4 \text{ mm} \)

Effective section modulus:
- with respect to the flange in compression:

\[ W_{\text{eff},y,c} = \frac{I_{\text{eff},y}}{z_c} = \frac{22688890}{124.6} = 182094 \text{ mm}^3 \]

- with respect to the flange in tension:

\[ W_{\text{eff},y,t} = \frac{I_{\text{eff},y}}{z_f} = \frac{22688890}{122.4} = 185367 \text{ mm}^3 \]
Resistance of members

Buckling strength of bending members

- Example – Design of an cold-formed steel beam in bending

Effective section properties at the ultimate limit state

Effective section modulus:

- with respect to the flange in compression:

\[ W_{e,y,c} = \frac{I_{e,y}}{z_c} = \frac{2268890}{124.6} = 182094 \text{ mm}^3 \]

- with respect to the flange in tension:

\[ W_{e,y,t} = \frac{I_{e,y}}{z_t} = \frac{2268890}{122.4} = 185367 \text{ mm}^3 \]

\[ W_{e,y} = \min\left( W_{e,y,c}, W_{e,y,t} \right) = 182094 \text{ mm}^3 \]
Resistance of members

Buckling strength of bending members

Example – Design of an cold-formed steel beam in bending

Applied loading on the beam at ULS

\[ q_d = \gamma_G q_G + \gamma_Q q_Q = 1.35 \times 1.79 + 1.50 \times 4.5 = 9.17 \text{ kN/m} \]

Maximum applied bending moment about the major axis \( y-y \):

\[ M_{Ed} = \frac{q_d L^2}{8} = 9.17 \times 4.5^2 / 8 = 23.21 \text{ kNm} \]

Check of bending resistance at ULS

Design moment resistance of the cross section for bending

\[ M_{c,Rd} = W_{eff,y} f_{yb} / \gamma_M 0 = 182094 \times 10^{-9} \times 350 \times 10^3 / 1.0 = 63.73 \text{ kNm} \]

Verification of bending resistance

\[ \frac{M_{Ed}}{M_{c,Rd}} = \frac{23.21}{63.73} = 0.364 < 1 \quad \text{OK} \]
Resistance of members

Buckling strength of bending members

Determination of the reduction factor $\chi_{LT}$

Lateral-torsional buckling

$$\chi_{LT} = \frac{1}{\phi_{LT} + \sqrt{\phi_{LT}^2 - \bar{\lambda}_{LT}^2}} \quad \text{but} \quad \chi_{LT} \leq 1.0$$

$$\phi_{LT} = 0.5\left[1 + \alpha_{LT} (\bar{\lambda}_{LT} - 0.2) + \bar{\lambda}_{LT}^2\right]$$

$\alpha_{LT} = 0.34$ – buckling curve b
Resistance of members

Buckling strength of bending members

- **Example – Design of an cold-formed steel beam in bending**

**Determination of the reduction factor $\chi_{LT}$**

*Lateral-torsional buckling*

\[
\chi_{LT} = \frac{1}{\phi_{LT} + \sqrt{\phi_{LT}^2 - \lambda_{LT}^2}} \quad \text{but} \quad \chi_{LT} \leq 1.0
\]

\[
\phi_{LT} = 0.5 \left[ 1 + \alpha_{LT} \left( \lambda_{LT} - 0.2 \right) + \lambda_{LT}^2 \right]
\]

\[
\alpha_{LT} = 0.34 \quad \text{– buckling curve b}
\]

The non-dimensional slenderness is

\[
\lambda_{LT} = \sqrt{\frac{W_{eff \cdot y \cdot \min \cdot f_{yb}}}{M_{cr}}}
\]

\[
M_{cr} = C_1 \frac{\pi^2 EI_z}{L^2} \sqrt{\frac{I_w}{I_z}} + \frac{L^2 GI_i}{\pi^2 EI_z}
\]

$C_1 = 1.127$ for a simply supported beam under uniform loading
Resistance of members

Buckling strength of bending members

- **Example – Design of an cold-formed steel beam in bending**

**Determination of the reduction factor $\chi_{LT}$**

$$M_{cr} = 1.127 \times \frac{\pi^2 \times 210000 \times 244.24 \times 10^4}{4500^2} \times \sqrt{\frac{17692.78 \times 10^6}{244.24 \times 10^4} + \frac{4500^2 \times 81000 \times 7400}{\pi^2 \times 210000 \times 244.24 \times 10^4}}$$

$$M_{cr} = 27.66 \text{ kNm}$$

$$\lambda_{LT} = \sqrt{\frac{W_{eff,y,min} f_{yb}}{M_{cr}}} = \sqrt{\frac{182094 \times 350}{27.66 \times 10^6}} = 1.518$$

$$\phi_{LT} = 0.5 \left[ 1 + \alpha_{LT} \left( \lambda_{LT} - 0.2 \right) + \lambda_{LT}^2 \right] = 0.5 \times \left[ 1 + 0.34 \times (1.437 - 0.2) + 1.437^2 \right] = 1.743$$

$$\chi_{LT} = \frac{1}{\phi_{LT} + \sqrt{\phi_{LT}^2 - \lambda_{LT}^2}} = \frac{1}{1.743 + \sqrt{1.734^2 - 1.437^2}} = 0.369$$
Resistance of members

Buckling strength of bending members

- **Example – Design of an cold-formed steel beam in bending**

Check of buckling resistance at ULS
Design moment resistance of the cross section for bending

\[ M_{b, Rd} = \chi_{LT} W_{eff,y} f_{yb} / \gamma_{M1} = \]
\[ = 0.369 \times 182091 \times 10^{-9} \times 350 \times 10^3 / 1.0 = \]
\[ = 23.52 \text{ kNm} \]
Resistance of members

Buckling strength of bending members

- **Example – Design of an cold-formed steel beam in bending**

Check of buckling resistance at ULS
Design moment resistance of the cross section for bending

\[ M_{b,Rd} = \chi_{LT} W_{eff,y} f_{yb} / \gamma_{M1} = \]
\[ = 0.369 \times 182091 \times 10^{-9} \times 350 \times 10^3 / 1.0 = \]
\[ = 23.52 \text{ kNm} \]

Verification of buckling resistance

\[ \frac{M_{Ed}}{M_{b,Rd}} = \frac{23.21}{23.52} = 0.987 < 1 \quad \text{OK} \]
Resistance of members

Buckling of members in bending and axial compression

• **Design of beam-columns according to EN1993-1-1 and EN1993-1-3**

  Two different formats of the interaction formulae

  Method 1 (Annex A of EN 1993–1–1) contains a set of formulae that favours transparency and provides a wide range of applicability together with a high level of accuracy and consistency.

  Method 2 (Annex B of EN 1993–1–1) is based on the concept of global factors, in which simplicity prevails against transparency. This approach appears to be the more straightforward in terms of a general format.
Resistance of members

Buckling of members in bending and axial compression

- Design of beam-columns according to EN1993-1-1 and EN1993-1-3

Members which are subjected to combined bending and axial compression should satisfy:

\[
\frac{N_{Ed}}{\chi_y N_{Rk} / \gamma_{M1}} + k_{yy} \frac{M_{y,Ed} + \Delta M_{y,Ed}}{\chi_{LT} M_{y,Rk} / \gamma_{M1}} + k_{yz} \frac{M_{z,Ed} + \Delta M_{z,Ed}}{M_{z,Rk} / \gamma_{M1}} \leq 1.0
\]

\[
\frac{N_{Ed}}{\chi_z N_{Rk} / \gamma_{M1}} + k_{zy} \frac{M_{y,Ed} + \Delta M_{y,Ed}}{\chi_{LT} M_{y,Rk} / \gamma_{M1}} + k_{zz} \frac{M_{z,Ed} + \Delta M_{z,Ed}}{M_{z,Rk} / \gamma_{M1}} \leq 1.0
\]
Resistance of members

Buckling of members in bending and axial compression

- Design of beam-columns according to EN1993-1-1 and EN1993-1-3

Members which are subjected to combined bending and axial compression should satisfy:

\[
\frac{N_{Ed}}{\chi_y N_{Rk} / \gamma_{M1}} + k_{yy} \frac{M_{y,Ed} + \Delta M_{y,Ed}}{\chi_L T y, Rk / \gamma_{M1}} + k_{yz} \frac{M_{z,Ed} + \Delta M_{z,Ed}}{M_{z, Rk} / \gamma_{M1}} \leq 1.0
\]

\[
\frac{N_{Ed}}{\chi_z N_{Rk} / \gamma_{M1}} + k_{zy} \frac{M_{y,Ed} + \Delta M_{y,Ed}}{\chi_L T y, Rk / \gamma_{M1}} + k_{zz} \frac{M_{z,Ed} + \Delta M_{z,Ed}}{M_{z, Rk} / \gamma_{M1}} \leq 1.0
\]

Values for \( N_{Rk} = f_y A_i, M_{i, Rk} = f_y W_i \) and \( \Delta M_{i, Ed} \)

Resistance of members

Buckling of members in bending and axial compression

- **Design of beam-columns according to EN1993-1-1 and EN1993-1-3**

  Members which are subjected to combined bending and axial compression should satisfy:

  \[
  \frac{N_{Ed}}{\chi_y N_{Rk} / \gamma_{M1}} + k_{yy} \frac{M_{y,Ed} + \Delta M_{y,Ed}}{\chi_{LT} M_{y,Rk} / \gamma_{M1}} + k_{yz} \frac{M_{z,Ed} + \Delta M_{z,Ed}}{M_{z,Rk} / \gamma_{M1}} \leq 1.0
  \]

  \[
  \frac{N_{Ed}}{\chi_z N_{Rk} / \gamma_{M1}} + k_{zy} \frac{M_{y,Ed} + \Delta M_{y,Ed}}{\chi_{LT} M_{y,Rk} / \gamma_{M1}} + k_{zz} \frac{M_{z,Ed} + \Delta M_{z,Ed}}{M_{z,Rk} / \gamma_{M1}} \leq 1.0
  \]

  The interaction factors \(k_{yy}, k_{yz}, k_{zy}, k_{zz}\) depend on the method which is chosen, being derived from two alternative approaches: (1) Alternative method 1 – see Tables 4.7 and 4.8 (Annex A of EN1993-1-1) and (2) Alternative method 2 – see Tables 4.9, 4.10 and 4.11 (Annex B of EN1993-1-1).
Resistance of members

Buckling of members in bending and axial compression

- Design of beam-columns according to EN1993-1-1 and EN1993-1-3

As an alternative, the interaction formula may be used

\[
\left( \frac{N_{Ed}}{N_{b,Rd}} \right)^{0.8} + \left( \frac{M_{Ed}}{M_{b,Rd}} \right)^{0.8} \leq 1.0
\]
Behaviour and Design Resistance of Bar Members

Beams restrained by sheeting

Behaviour and Design Resistance of Bar Members

Beams restrained by sheeting

- **Modeling of beam-sheeting interaction**

To evaluate the restraining effect of sheeting, in EN1993-1-3 the free flange is considered as a beam on an elastic foundation

The equivalent lateral spring stiffness for the strength and stability check is obtained by a combination of:
The equivalent lateral spring stiffness for the strength and stability check is obtained by a combination of:

1. Rotational stiffness of the connection between the sheeting and the purlin $C_D$. 

• Modeling of beam-sheeting interaction
The equivalent lateral spring stiffness for the strength and stability check is obtained by a combination of:

1. Rotational stiffness of the connection between the sheeting and the purlin $C_D$,
2. Distortion of the cross section of the purlin, $K_B$,
The equivalent lateral spring stiffness for the strength and stability check is obtained by a combination of:

1. Rotational stiffness of the connection between the sheeting and the purlin $C_D$,
2. Distortion of the cross section of the purlin, $K_B$,
3. Bending stiffness of the sheeting, $C_{D,C}$, perpendicular to the span of the purlin (see Figure 4.49).
Resistance of members

Behaviour and Design Resistance of Bar Members

Beams restrained by sheeting

- Modeling of beam-sheeting interaction

According to EN1993-1-3, the partial torsional restraint may be represented by a rotational spring with a spring stiffness $C_D$, which can be calculated based on the stiffness of the sheeting and the connection between the sheeting and the purlin, as follows,

$$\frac{1}{C_D} = \frac{1}{C_{D,A}} + \frac{1}{C_{D,C}}$$

where

- $C_{D,A}$ is the rotational stiffness of the connection between the sheeting and the purlin;
- $C_{D,C}$ is the rotational stiffness corresponding to the flexural stiffness of the sheeting.

Both $C_{D,A}$ and $C_{D,C}$ are specified in Section 10.1.5 of EN1993-1-3.
Resistance of members

Behaviour and Design Resistance of Bar Members

Beams restrained by sheeting

- **Modeling of beam-sheeting interaction**

The restraints of the sheeting to the purlin have important influence on the buckling behaviour of the purlin.

Buckling curves of a simply supported zed section beam with different restraint applied at the junction between web and compression flange subjected to pure bending ($h=202 \text{ mm}$, $b=75 \text{ mm}$, $c=20 \text{ mm}$, $t=2.3\text{mm}$) (Martin & Purkiss, 2008)

Conceptual design

Introduction

Case Studies – Structural Performances

• Conceptual design principles

Designing cold-formed steel building structures is based on the conceptual framing of designed conventional steel structures. However, the designer has to manage four specific categories of problems which characterise the behaviour and performance of cold-formed thin-walled structures: i.e.

- Stability and local strength of sections;
- Connecting technology and related design procedures;
- Reduced ductility with reference to ductility, plastic design and seismic resistance;
- Low fire resistance

If compares with conventional steel construction (EN 1993-1-1), the fact that structural members of a cold formed steel –structures are, in general, of class 4, involves to work with effective cross sections of members in compression - bending. Even the general rules are similar, the members, stiffness is wakened by local instability increasing the risk of instability of these structures; their sensitivity to imperfections and 2nd order effects must carefully controlled by proper analyses and design.
